Saving the Project

Our final step will be to save our current forecasting session as a *project*.

Select the **File** tab on the ribbon menu. On the left-hand side of the tab, select “Save As”. Save the project using the name *test project*.

Be aware that a project saves the data, forecasts and overrides that are currently in memory. If you update your input data files after saving a project, when you reopen the project you’ll have the option of either opening the project as it existed when you saved it or reading in the updated data and revising the forecasts.
